Book Description: Including many algorithms described in simple terms, this textbook stresses common techniques (such as generating functions and recursive construction) that underlie the great variety of subject matter, and the fact that a constructive or algorithmic proof is more valuable than an existence proof.

The chapters have "techniques" and "algorithms." It's not a book that has a slew of examples of combinatorial problems (like so many), but leans toward mathematical sophistication in formalizing the techniques. This is either a feature or a bug, depending on what you needs are.

algorithms. This thesis discusses a divide-and-conquer approach by which loopless algorithms can be developed more easily and intuitively: fusing loopless al-gorithms. If a combinatorial generation problem can be divided into subprob-lems, it may be possible to conquer it looplessly by fusing loopless algorithms for its subproblems.
