The fractal analysis has been widely used in exploration geophysics. In gravity and magnetism it is used for causative sources characterization [1,2, 3, 4]. In seismology, the fractal analysis is used for earthquake characterization [5, 6; 7].

Fractals A fractal is an irregular, self-similar geometric object that can be subdivided into parts each of which is a reduced-size copy of the whole. Fractals are therefore scale-invariant since they appear identical following scale reduction or magnification.

Fractal - an overview | ScienceDirect Topics

Abstract Many geophysical variables exhibit fractal or at least scaling behaviour, notably in having power spectra proportional to some power of frequency. Power spectra of magnetic susceptibility logs from boreholes are proportional to spatial frequency f^{-2} for wavelengths from 0.1 to 100 m.

Fractal magnetization of continental crust - Pilkington ...

At least two parameters are required to describe a fractal model; one parameter typically describes how roughness changes with scale, while the other specifies the variance or surface slope at a reference scale. The divider method and the spectral method are in common use to determine the best fit fractal model from surface profile data.
