Because raindrops tend to become oblate (flatten out) as they fall, weather radar systems have traditionally employed horizontal linear polarization. This method allows improved signal returns from weather targets.

RADAR Basics - National Weather Service

Radar sets use the echo to determine the direction and distance of the reflecting object. The term RADAR is an acronym made up of the words: RAdio (Aim)^o (Aim) Detecting And Ranging. The term "RADAR" was officially coined as an acronym by U.S. Navy Lieutenant Commander Samuel M. Tucker and F. R. Furth in November 1940.

Radar basics and the doppler shift NEXRAD (Next Generation Radar) obtains weather information (precipitation and wind) based upon returned energy. The radar emits a burst of energy (green in the animated image). If the energy strikes an object (rain drop, snowflake, hail, bug, bird, etc), the energy is scattered in all directions (blue).
